

DR. JOHN F. ANDERSON

August 18, 1926

A doctor of Medicine acting as Director  
of Squibb's New Brunswick Research  
Laboratory.

TESTIFIED (page 523c et seq.):

Recited his qualifications as expert and that he had  
specialized in analysis to determine amounts of blood and identi-  
fication of blood stains (523-c)

On October 2, 1922 received 158 pounds of soil, etc.  
from scene. A description of work he did (524-5).

In Anderson's opinion throat was cut after death because  
living people bleed more freely (526).

Would expect to find six pints of blood from a throat  
cut while heart was beating. Only found about 8/10 of a pint (526).

Could not tell from analysis whether victims killed at  
spot but they were in his opinion (526-7).

CROSSEXAMINATION:

In Anderson's opinion throat must have been cut within  
half an hour after Mrs. Mills was shot (527).
